

Trimble GPSCorrect is an ArcGIS Extension that is installed on a mobile device used for setting the quality of GPS positions accepted for data capture.

While ESRI ArcPAD can be used without this extension, collected GPS data CANNOT be differentially corrected without this extension since GPSCorrect collects key satellite measurement. This extension is also necessary to filter incoming GPS signals by PDOP, SNR or elevation mask.

GPSCorrect appears as a menu in ESRI ArcPad.

It is developed by and purchased from Trimble.
