

Storing and using autonomous GPS data (no real-time or post processing) **would be the ONLY way to keep your data in WGS84** as it came from the satellites. This is not practical since...

The accuracy of this data is only accurate to 15 m since it remains uncorrected

and

Most GIS datasets you will want to combine your GPS data are not WGS-84

Therefore it is impossible to avoid datum issues when moving GPS data to a GIS
